

Remote, keyless
locking has never
looked so good

Simons Voss
technologies

ALLEGION

Pure logic

Keyless locking. The perfect combination of ease and security.

Locking and unlocking cars with electronic remote control keys has long been standard practice. With MobileKey by SimonsVoss this simplicity can be used on doors too.

Our innovative system makes use of the very latest state-of-the-art locking technology. The MobileKey system replaces a traditional key with a digital transponder, a PINCode keypad or your smart phone. Instead of a mechanical cylinder, you install an electronic one. This can be done in just a few simple steps with no wires, and no drilling. Then, through our free web app, you can configure the system all by yourself!

This well-designed, all-inclusive solution is suitable for up to 20 doors and 100 users, while still being affordable and inexpensive to run.

MobileKey is the latest product from SimonsVoss - a German company that is a world technology leader in electronic locking and access control systems.

Digital transponders and cylinders instead of traditional mechanical locks and keys - this is the future of security.

The future is here.

Long live
simplicity!

Manfred K.,
Architect and interior designer

MobileKey can be retrofitted and stands out with its beautiful and timeless design. The system is astonishingly simple to put into operation and you can easily configure it yourself with the free web app.

No more annoyance
over lost keys.

Doris M.,
Shop owner

The digital locking system offers me the highest degree of comfort and security. If I lose a transponder, I can block it with my smart phone and then simply program a new one.

It doesn't
get much clearer.

Mathias K.,
Attorney

I want to know who is in what room and for how long. MobileKey records every single locking process. The door cylinder is equipped with intelligent door monitoring to let me know the locking status of every single door in real time.

My kids
love it!

Barbara Y.,
Homemaker and mother

Having many keys is a thing of the past. One transponder for all doors – simply ingenious! And it looks great. I can modify access rights with my smartphone whenever I want - it doesn't get much better than this!

Simple

With MobileKey, web-based access control is just a few clicks away.

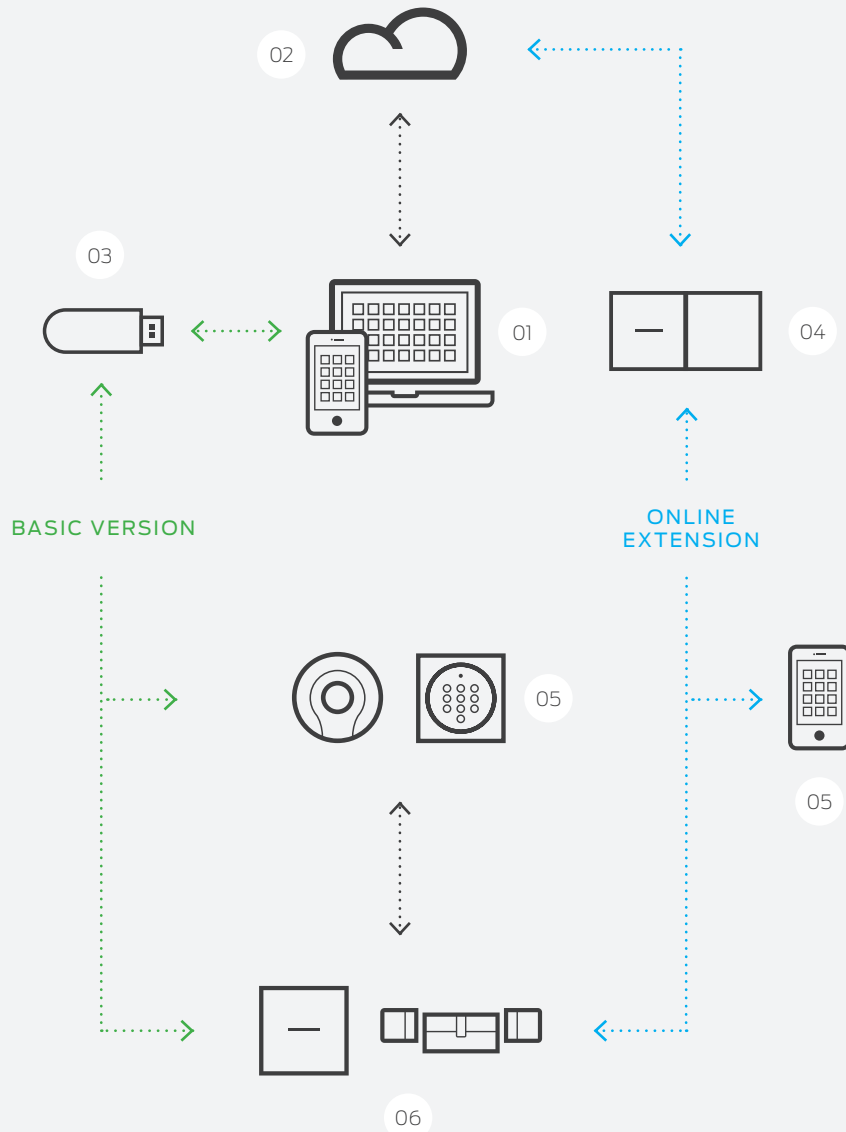

You can use your PC, tablet or smartphone to create personal locking plans. You are able to control who is allowed to enter which rooms, when and for how long. It takes just a few simple clicks, then the data is transmitted to digital door cylinders with the configuration device or via SmartBridge in the online version.

The frustration of having lost your keys is now a thing of the past. If you lose a transponder, you simply block it in a matter of seconds. Setting up a new one takes just a couple of minutes.

And what if friends or workmen are at your door while you're away? With the online version of MobileKey, you can simply unlock your door from wherever you happen to be!

Setting up and running MobileKey is super easy with our free web application – you are just a few clicks away from added comfort and security.

Web-based locking system for up to 20 doors and 100 users.

01. Web app

MobileKey is set up and managed using an app. This app can be run on all internet-ready devices such as PCs, tablets, Macs and smartphones. With just a few clicks you can specify who has access to which areas and you can change authorisations as many times as you need.

02. SimonsVoss server

Web app data is transmitted to the SimonsVoss server, where it is applied as a locking plan and then sent back to the app. Everything is automatic.

03. Basic version

The config device allows you to transfer data to your transponders and locking components.

04. Optional: online extension

In the online version, your networked locking components connect directly with the server via a SmartBridge. This ensures system equipment and authorisation changes are implemented in real time. Full control anywhere at any time.

05. Remote control key as an ID medium

Unlock without the need for mechanical keys using a transponder, PinCode keypad or smartphone. Changing to digital locking could not be simpler.

06. Locking components

Press the button and your wireless key transmits individual stored authorisations to the digital cylinders or a specially designed relay. If the authorisation fits, the door or gate will then unlock.

07. Security takes top priority

Your data is stored on an audited SimonsVoss server in Munich, Germany. No need to worry about your data security management: we will take care of it for you - with the very highest level of security.

Beautiful

Everyday Elegance

Our motto is 'innovative technology in perfect design'.

The visible components of MobileKey perfectly fit in with both a modern and a classic environment.

We are proud to have won several international design awards that have recognised the sophisticated and timeless beauty of our products.

The elegant design of MobileKey brings out the beautiful side of progress.

Intelligent

With its highly sophisticated functions and clever features, MobileKey is redefining the world of locking.

MobileKey offers digital locking with the very latest state-of-the-art technology in place of conventional mechanical technology.

No wires, no drilling, virtually maintenance-free

Installation and replacement of cylinders is carried out entirely without wiring. Whether you are installing a cylinder for the first time or retrofitting; the job is done in no time, since no drilling or special tools are needed.

The corresponding electronic cylinders can be installed in just a few simple steps. They are equipped with several intelligent functions and are virtually maintenance-free, due to their extremely low energy consumption.

Time schedules and event logging

Time schedules let you define who has access, where and when. Event logging lets you see who accessed which rooms and at what time.

DoorMonitoring – the smallest door monitoring system in the world

Integrated sensors in the cylinder monitor the status of a door and record every change and any essential door activity is reported in real time.

Opting for digital locking technology means increased comfort and security.

LOCKING COMPONENTS

All MobileKey cylinders and SmartRelays offer a large number of intelligent functions. This includes access control with event logging of up to 500 accesses and individual time schedules.

MobileKey digital double thumb-turn cylinder: the all-rounder

In its standard version, the MobileKey freely rotating double thumb-turn cylinder is suitable for indoor as well as outdoor use and is equipped with the "Access Control" function for time schedules and access logging.

With integrated button cells you can perform up to 300,000 locking transactions. For the online extension of the locking system, MobileKey offers cylinders with integrated network capability.

Further models and options

:: Comfort version with button control:

Lets you open the door from the inside even without a transponder.

:: Weatherproof version:

For installation in unprotected outdoor areas, such as garden gates, fences, etc.

:: Multi-point version:

For use with doors with multi-point locking systems.

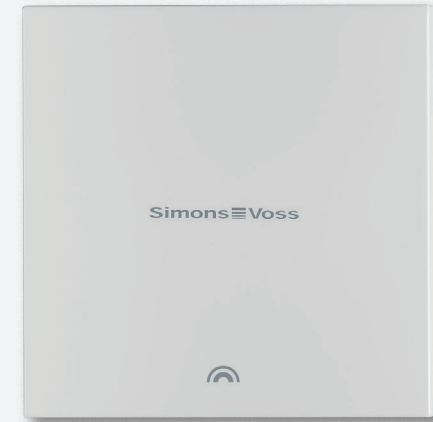

:: Half cylinder:

Predominantly used for gates and key switches in outdoor areas.

:: DoorMonitoring version:

Integrated sensors in the cylinder monitor the status of a door and record every change and any essential door activity is reported in real time.

LOCKING COMPONENTS

Digital SmartRelay MobileKey: the garage and roller shutter specialist

Typical areas of use for our electronic key switches are locking devices without cylinders, such as door openers, motorised locks, garage door, drives and other electronic solutions and systems.

There are two versions: a standard surface-mounted version in white housing, and a flush-fit version to be installed in switch boxes.

REMOTE CONTROL KEYS

Digital remote control keys completely replace your mechanical keys:
The battery-operated transponders and PIN code keypads authorise individuals
with access rights based on individually defined rules.

MobileKey Transponder

With our transponder, you have the future of keyless locking in your hands:
Wireless locking transactions at the press of a button.

With just one battery you can perform up to 400,000 locking transactions.

REMOTE CONTROL KEYS

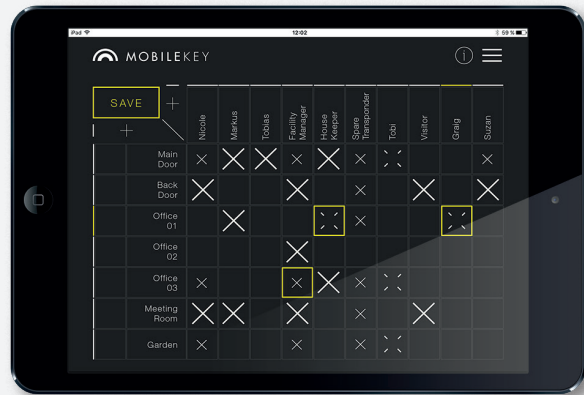

MobileKey PinCode Keypad

The perfectly flat and elegant PinCode keypad can be installed wirelessly indoors as well
as in outdoor areas - you can even mount it onto glass.

The keypad opens your doors when you enter a 4 to 8 digit code, which you can define and
change whenever you want.

MANAGING AND PROGRAMMING

When it comes to the development of web management and MobileKey programming, security and ease of use are our highest priority.

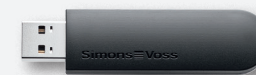

MobileKey Web app

The intuitive web app for all internet-enabled devices.

Advantages for users include non time-consuming backups which are always in line with the latest state-of-the-art technology. The web app is used to create locking plans with access authorisations, which are then stored on the SimonsVoss server.

Locking plans can be viewed and processed with any standard browser technology. The web service generates locking plan data automatically for the individual MobileKey system and makes the data available for programming with the USB configuration device.

MANAGING AND PROGRAMMING

MobileKey SmartBridge

Our online version is a system extension that lets you connect your locking system via a SmartBridge directly to the MobileKey web service. All programming tasks are retrieved via the SmartBridge and the locking devices are automatically programmed. You therefore no longer need the configuration device to programme the system. The online extension also enables a number of further functions, such as remote locking transactions or notification when doors open.

MobileKey USB configuration device

With the compact USB configuration device, you automatically transfer all data to the locking components in your MobileKey system.

A Windows-based computer (PC, notebook, netbook or tablet PC) with a USB port is required to programme the components. Further versions of the programming app are currently being developed.

Inspiring

MobileKey Inspires.

MobileKey has a number of distinct features that sets it apart from other systems. The connection to the web app, the intuitive handling, the performance scope, locking transactions via smart phone, the added security and comfort.

Our most convincing feature of all is the no-nonsense and quick installation of the digital cylinder – even when retrofitted. No wires, no drilling, no dirt.

MobileKey is quality “made in Germany” from the global technology leader for digital locking and access control systems.

Ingeniously simple, future-proof and cost effective.

The many advantages...

State-of-the-art remote control key.

Conventional keys are a thing of the past in the MobileKey system. Open your doors with merely a transponder, a PIN code keypad or your smart phone.

More than just locking.

Time schedules let you decide who has access, where and when. You can then see this information on your computer.

Intuitive web app and programming.

You can learn how to use the app in just a few minutes and then configure everything yourself.

Excellent cost efficiency.

MobileKey is low-cost and low-maintenance. It is the product of choice for locking systems with up to 100 users.

No more fretting over lost keys - ever again.

If you lose your transponder, you simply block it and activate a new one. And the best thing is: you no longer need to replace locks.

Simple installation, easy retrofit.

Simply replace the mechanical cylinder with a digital one. You can install it in just a few minutes. No wires, no drilling, no dirt!

Full flexibility with web management.

You can manage your system, create and block users, change authorisations and request the status of doors with MobileKey with any internet-capable device from anywhere in the world.

The total package.

Your specialist retailer would be happy to take care of the survey, installation and configuration of your locking plan, including programming.

Quality "made in Germany".

Over 1 million cylinders in more than 12,000 systems installed around the world have made SimonsVoss a leading manufacturer of digital locking systems.
